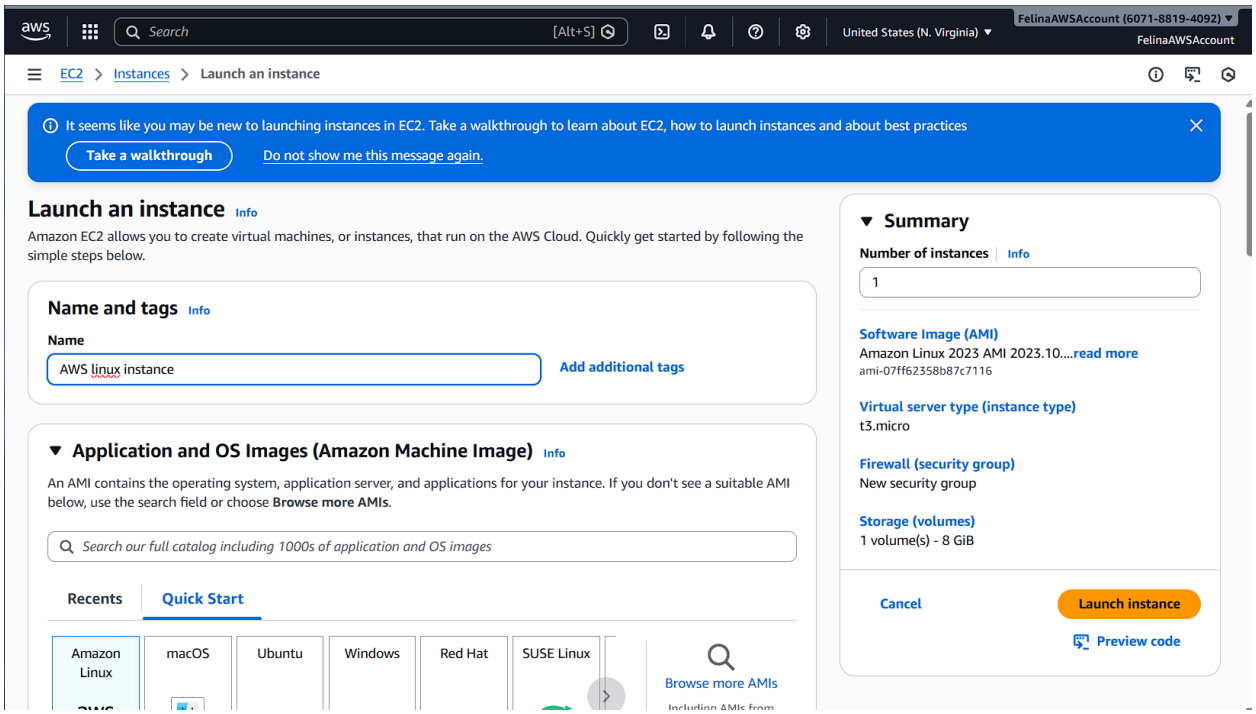
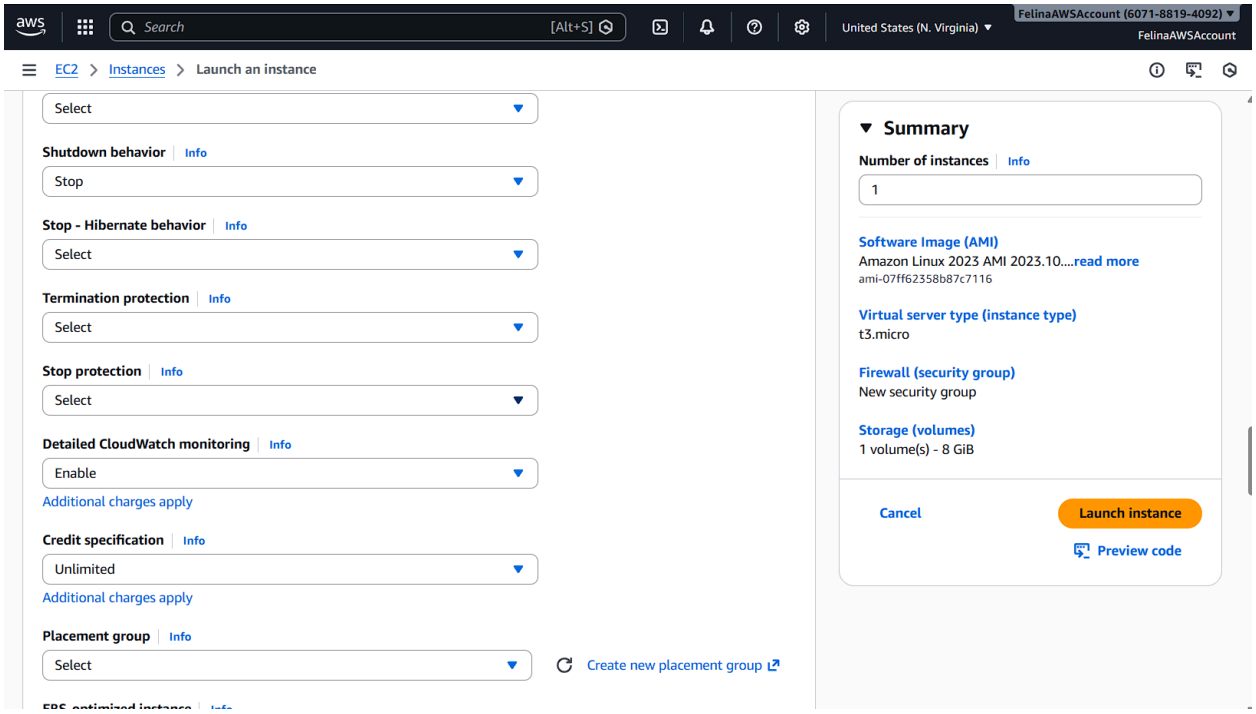
# EXPERIMENT 9
# CLOUDWATCH

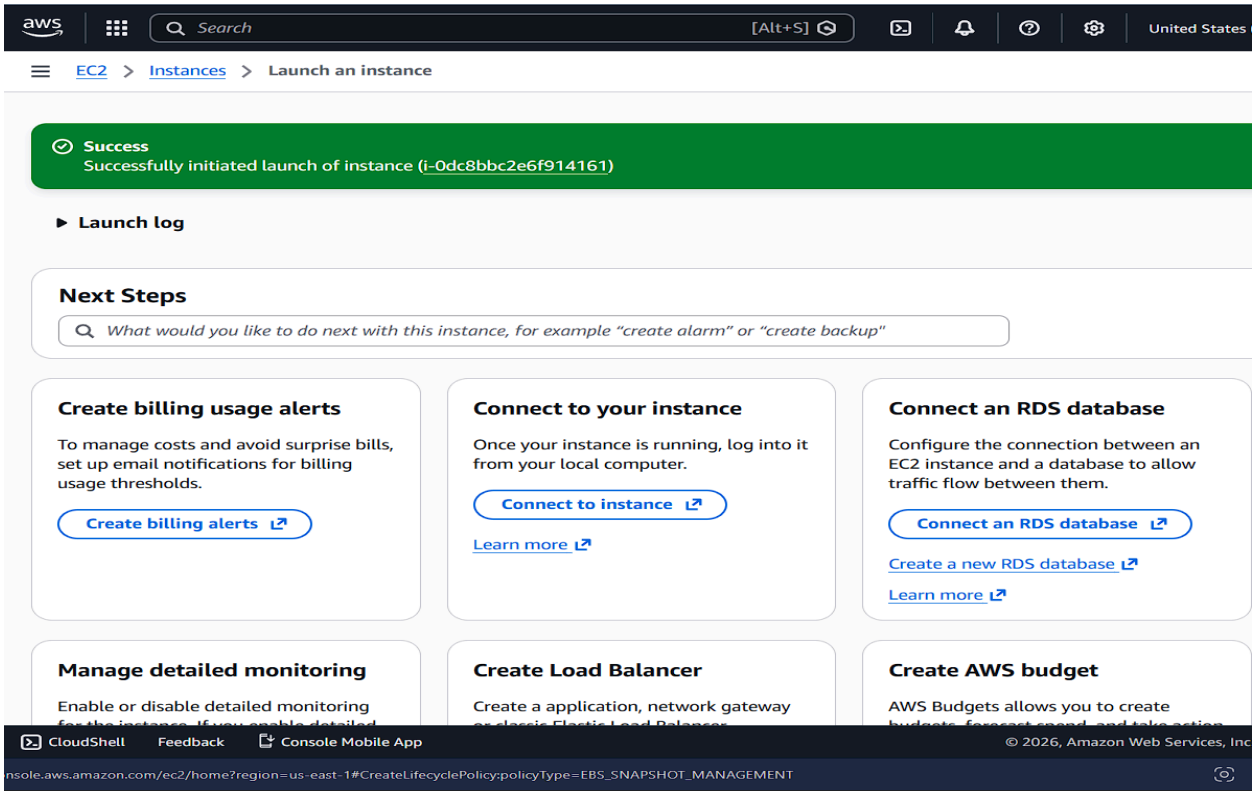
Create an amazon linux instance by enabling the monitoring feature in configure instances



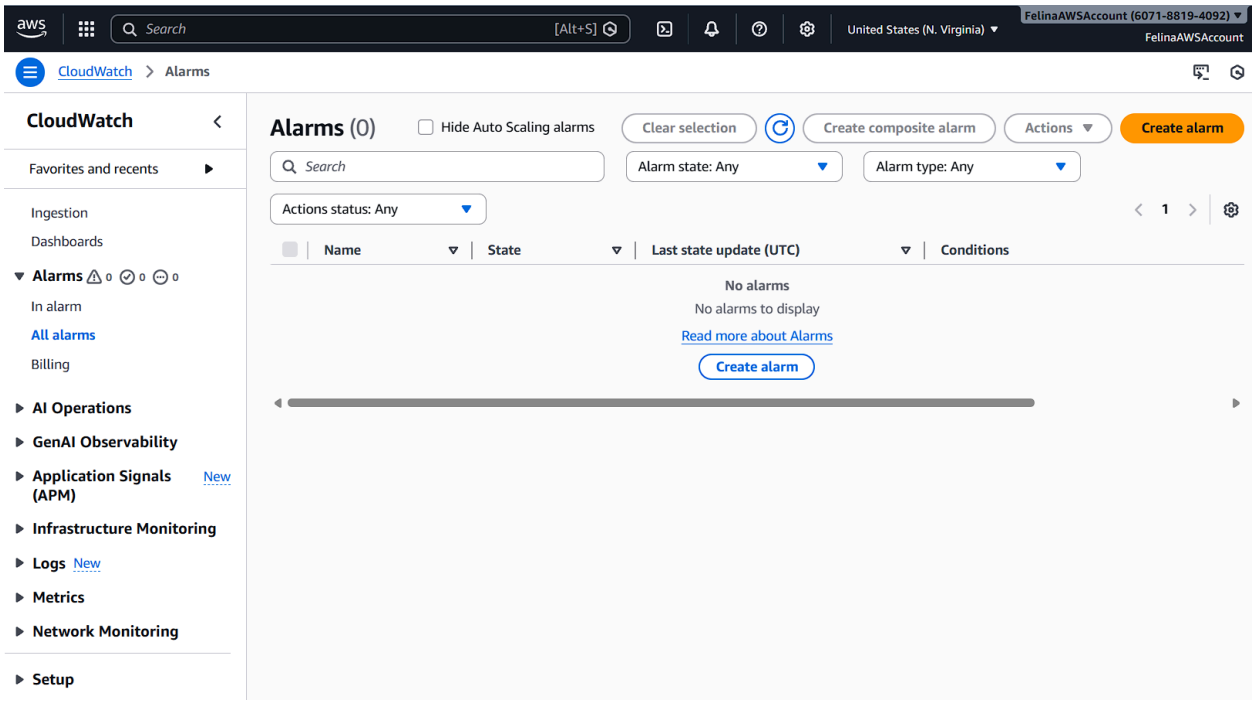
Advanced details ->Detailed Cloudwatch monitoring ->enable



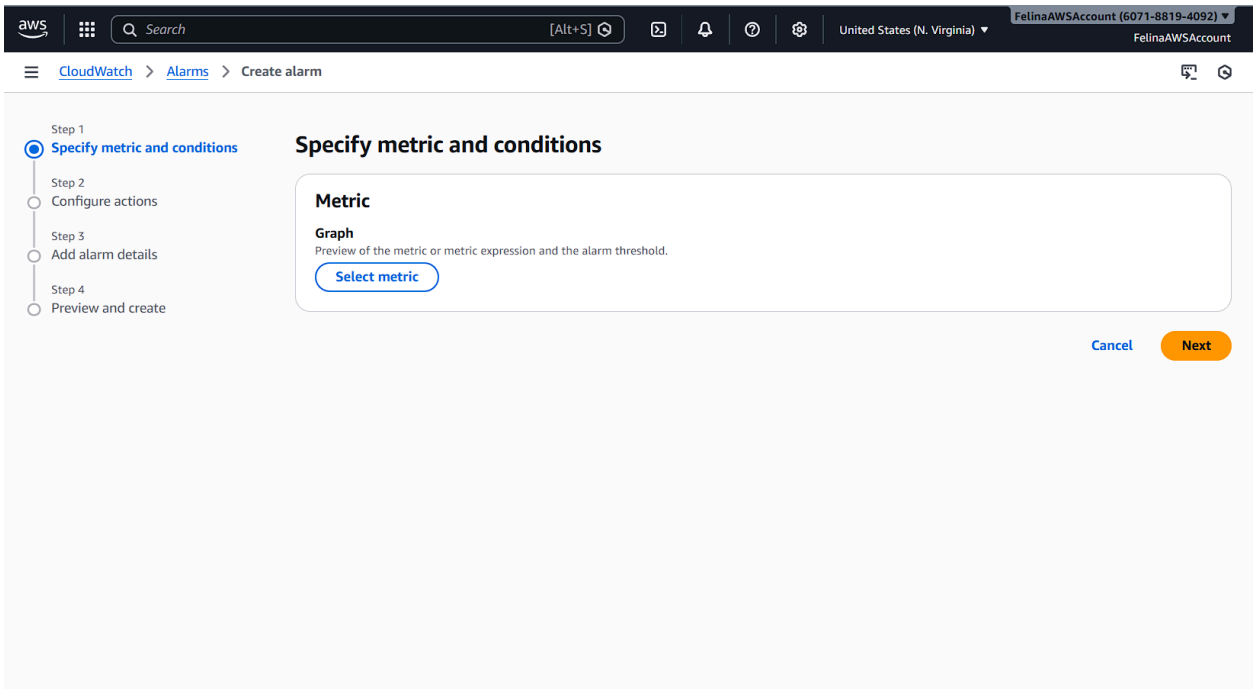
Instance has been created



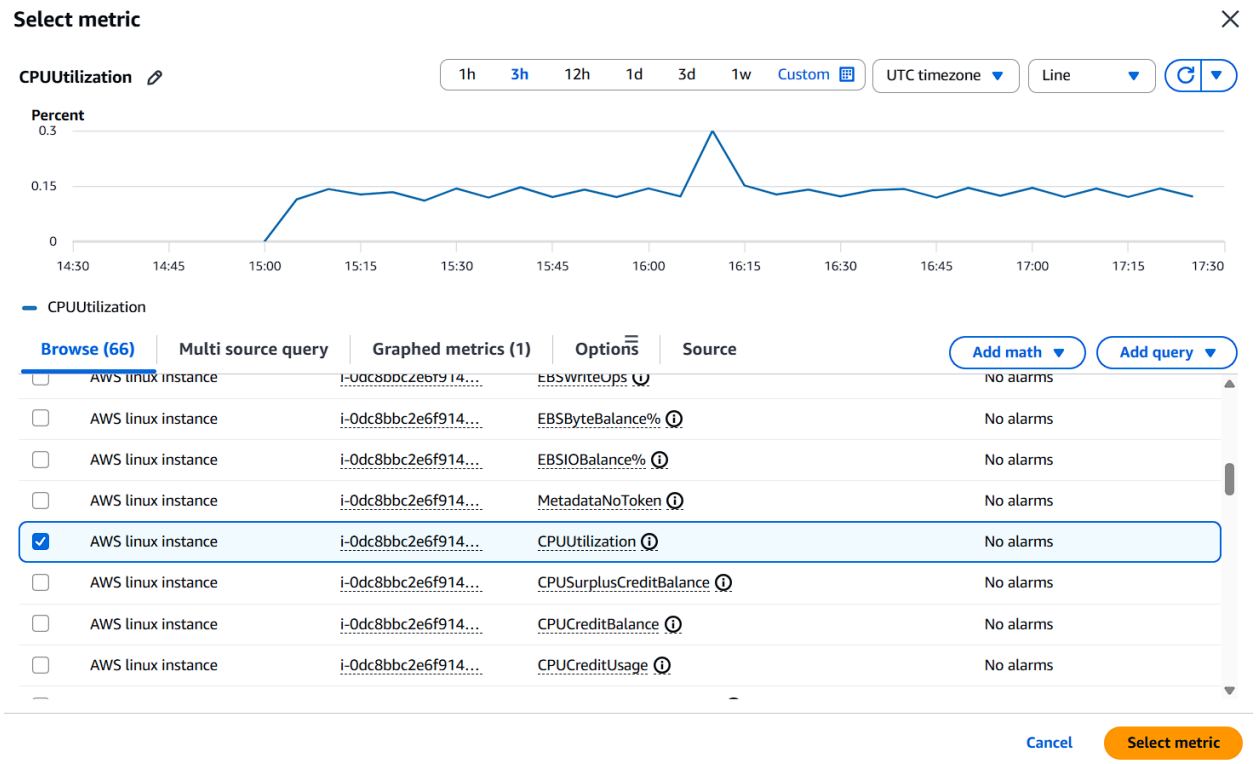
Services ->Cloudwatch ->Create alarm



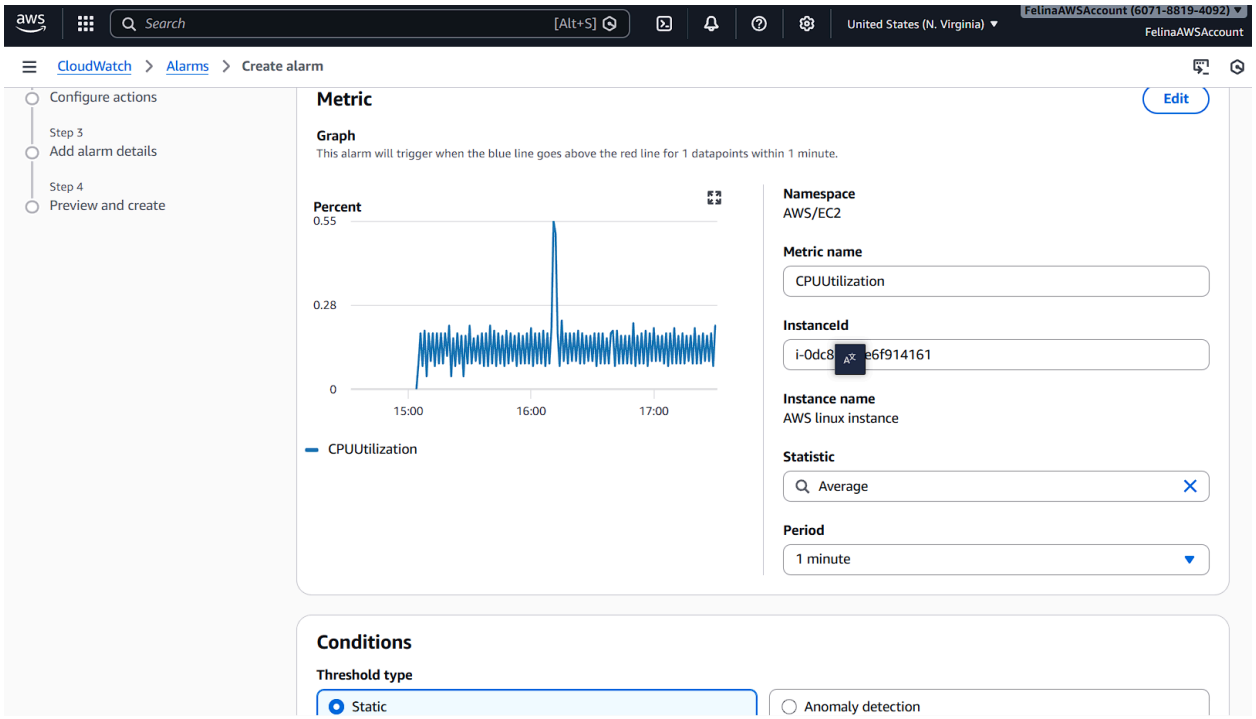
Click on select metric



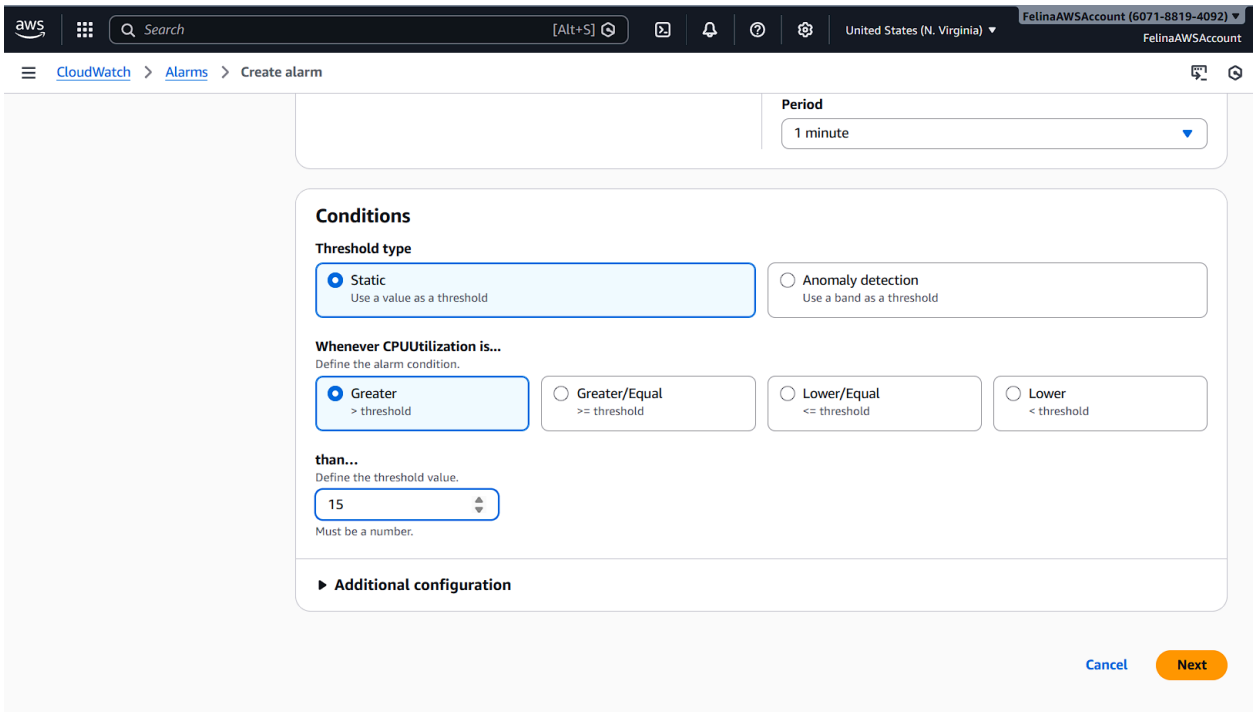
Choose EC2 ->Per-instance metrics ->Select the running instance with CPU Utilization



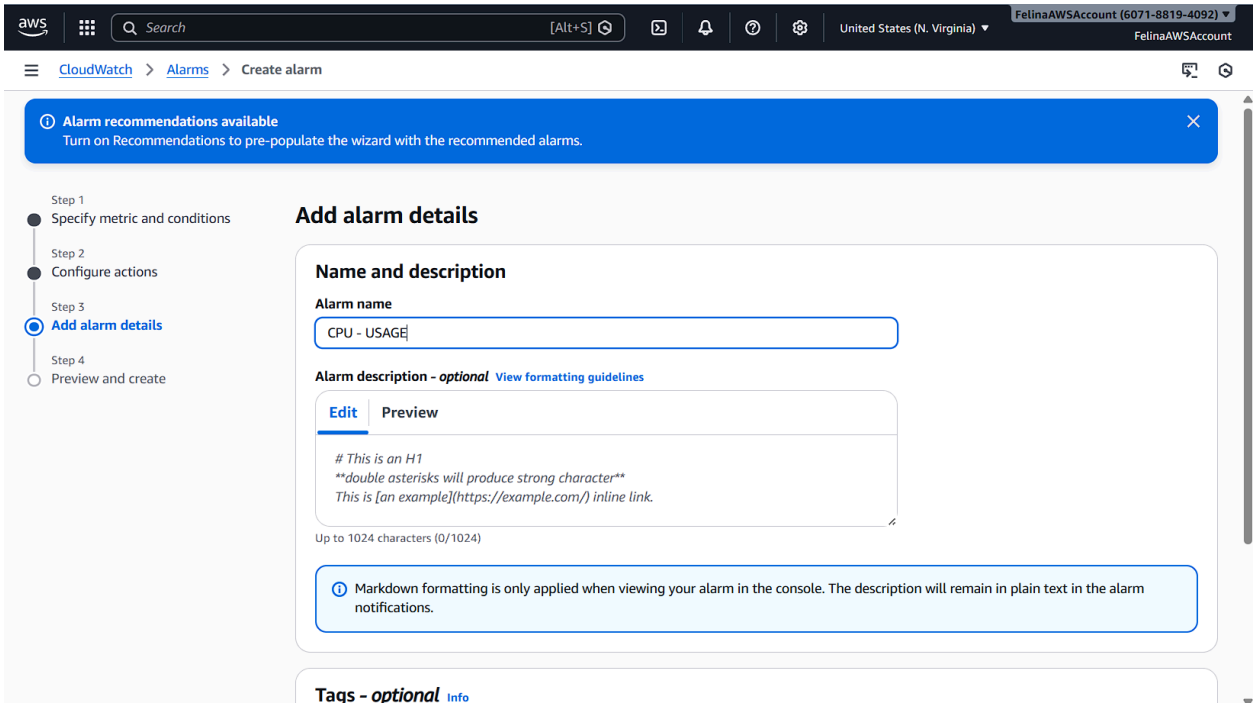
Specify the metric name and set the period to 1 minute



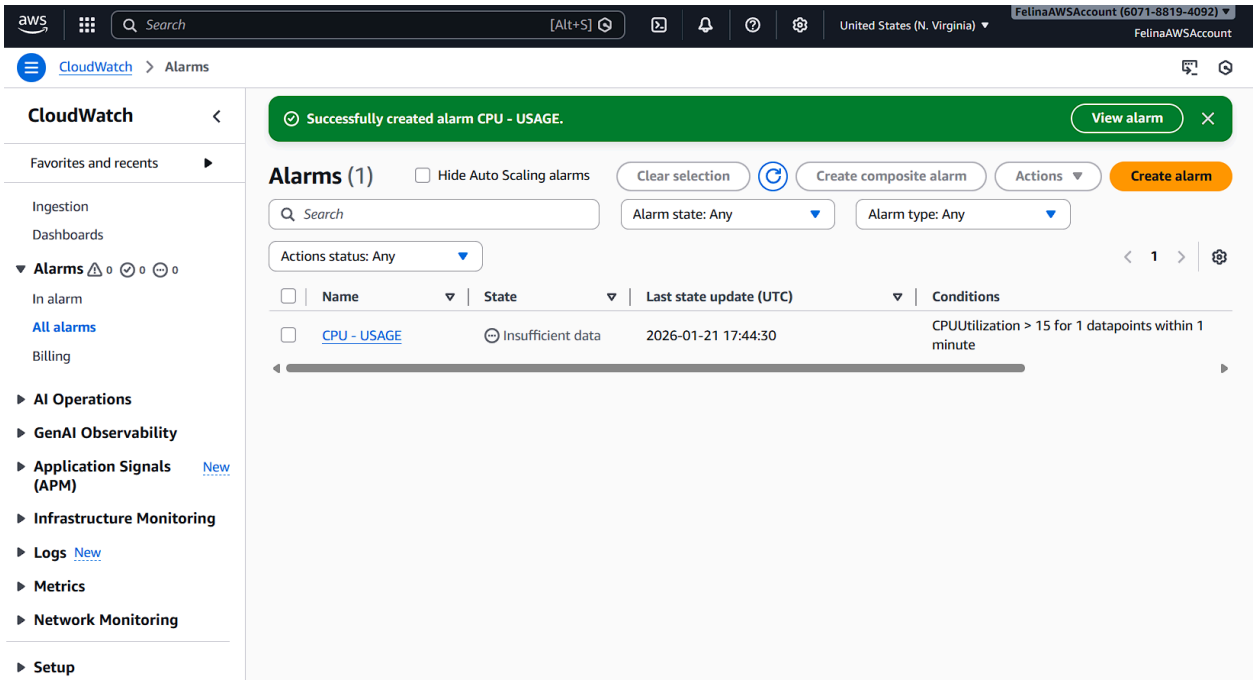
Set the threshold value to 15



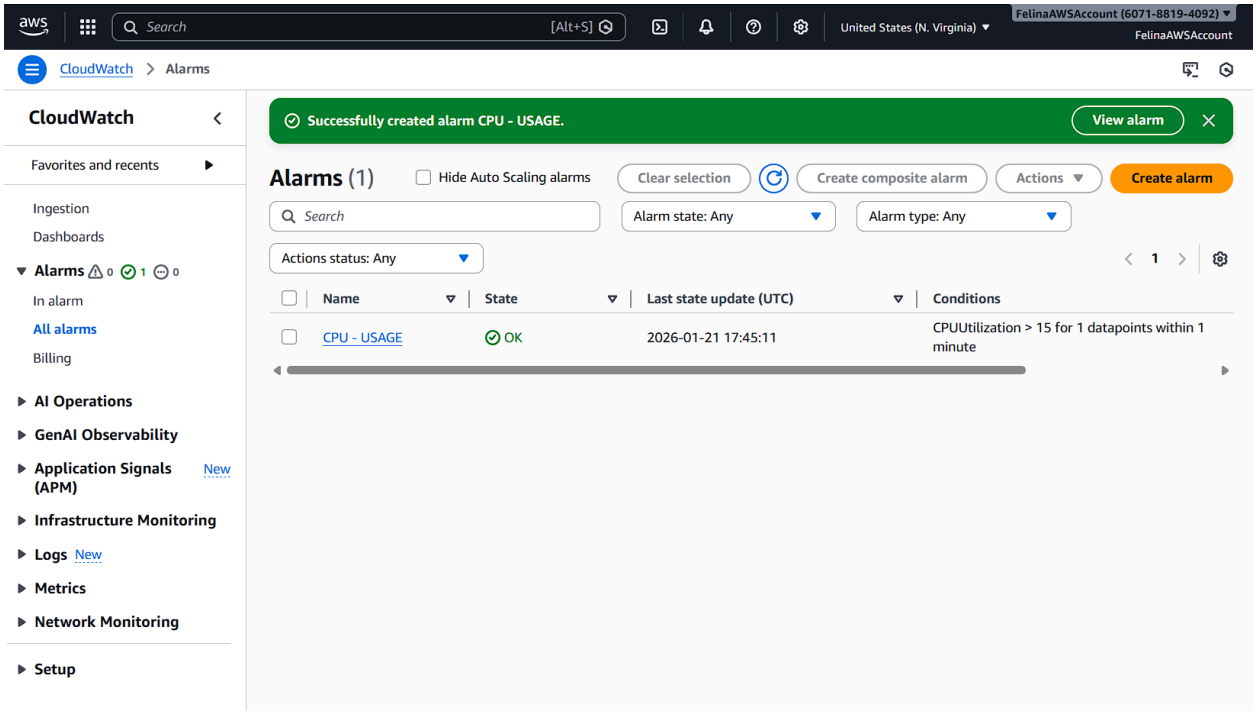
Specify the alarm name and create alarm



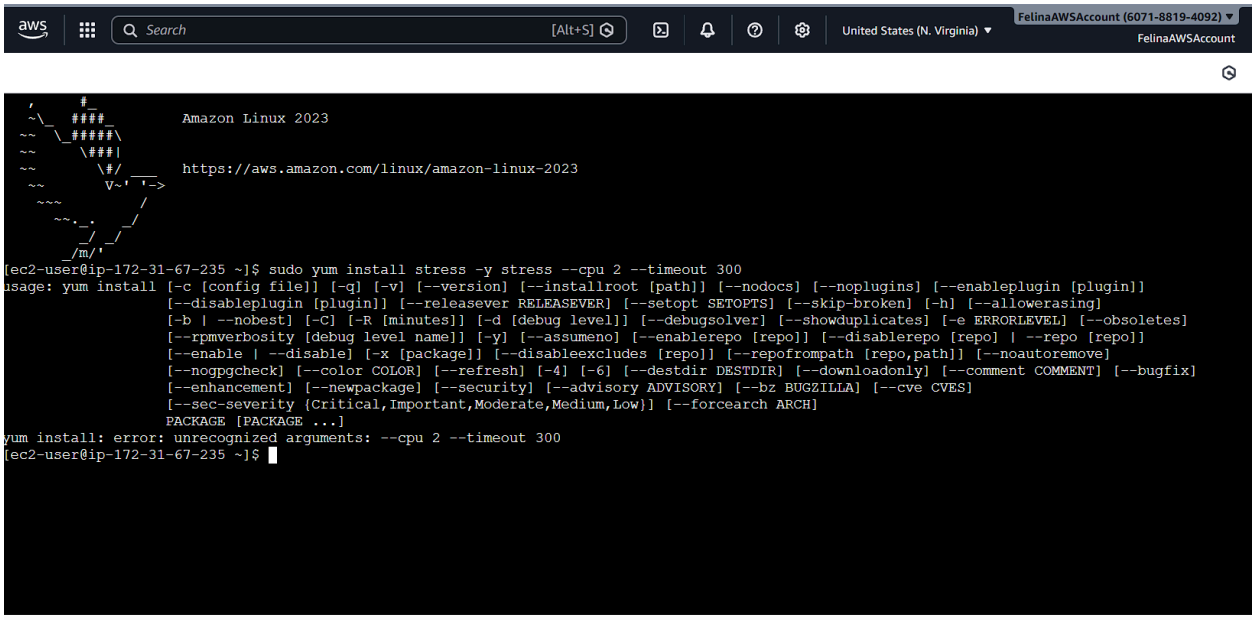
The alarm has been created and the alarm is in Insufficient data state

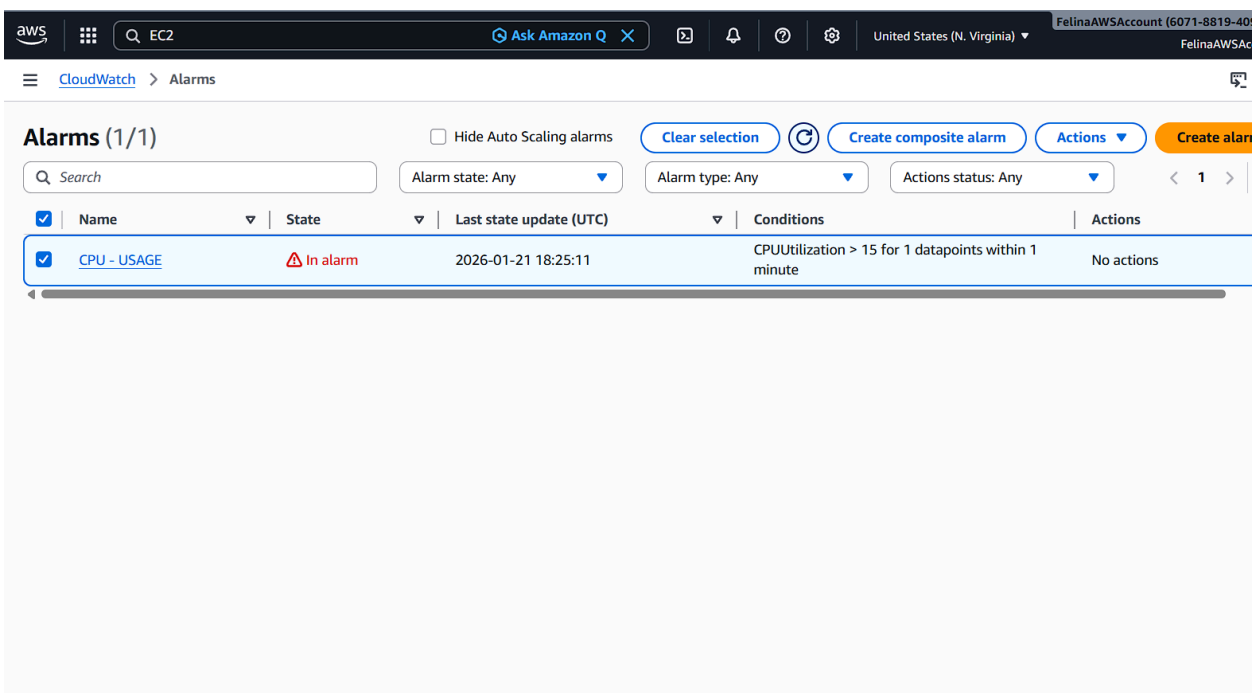


After some time the state will be changed to OK



Connect the created instance. In order to increase the cpu utilization the following commands has been performed





The alarm state has changed to In alarm
